Household Food Consumption Survey 1955
Report No. 14

Food Consumption and Dietary Levels of Households as Related to the Age of Homemaker United States -- by Region

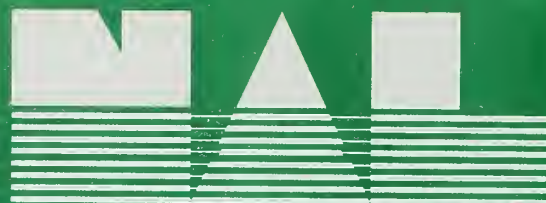

U. S. DEPARTMENT OF AGRICULTURE

Washington, D. C.

The nationwide survey of household food consumption report is based on data made in April-June 1955 by the Agricultural Marketing Research Service and the Agricultural Marketing Service, U.S. Department of Agriculture. The data were analyzed by the Agricultural Marketing Analysts, Inc., under contract with the Department of Agriculture.

The survey represents the cooperative effort of the Department of Agriculture, the Agricultural Marketing Service, the Institute of Home Economics, Agricultural Marketing Service, and the Agricultural Marketing Analysts, Inc., under contract with the Department of Agriculture. The survey was conducted under the assistance of George R. Rockwell, Jr., Chief, Division of Agricultural Marketing, and Thomas J. Lanahan, Jr., Chief, Division of the Agricultural Marketing Service.

and analysis of the sample were Earl Houseman and Robert M. Walsh.

The survey was carried out under the general direction of the Agricultural Marketing Service, and Robert M. Walsh, Chief, Agricultural Marketing Service.

The survey of food consumption and dietary levels of households of homemakers was prepared by the Household Food Consumption Division, Institute of Home Economics. In addition to the data reported above, Margaret Cussler, Corinne LeBovitz, and Thomas J. Lanahan, Jr., assisted with this report.

FOOD CONSUMPTION AND DIETARY LEVELS OF HOUSEHOLDS AS RELATED TO THE AGE OF HOMEMAKER UNITED STATES--BY REGION

HIGHLIGHTS

Differences in food consumption of households of different age composition as revealed by the nationwide Survey of Household Food Consumption in the spring of 1955 are of special interest for several reasons. First, the changing age composition of the population places increased importance on the consumption patterns of younger families and older ones. Second, much interest attaches to the question of the differences in acceptance of the newer foods by younger as contrasted with older women and the differences in consumption of specific food items of young and older families. Third, information on the nutritional adequacy of the food supplies of households in the various stages of the life cycle is of much importance in nutrition education. Information on these and other points is needed by nutritionists and those marketing food. While the succeeding analysis refers to consumption of households rather than of individuals, the age of the homemakers may be taken as a reasonably good index of the average age of family members, as associated with key stages of the family life cycle.

Money Value of Food Used at Home

Peak expenditures for food are made by families in which the housewife is between 30 and 50 years old. Up to the time the homemaker reaches 50, as her family grows in number and in age, both per person food consumption and household food expense increase. At the stage of the family life cycle when the homemaker is between 30 and 50, families are largest and some of the children have become hearty eaters. After this the size of the household and total household food expense taper off. When the homemaker is between 50 and 60 there are proportionally more adults in the household, and it is then that the food expense per person tends to be greatest. The food expenditure for the entire household is then at almost the same level as that of the under 30 group, with the smaller size of the family being approximately balanced by the greater consumption per member. Finally, when the homemaker is 60 years or older, family size is still smaller, and the per person money value of food declines--but not to the level of the youngest families.

These trends are shown in the following comparison of the money value of food used in a week per household and per person, along with average household size and the percentage of households with children under 16 years, for households classified by age of the homemaker:

Age of homemaker:	<u>Household size (persons)</u>	<u>Percentage with children under 16 years</u>	<u>Money value of food Per household</u>	<u>Per person</u>
Under 30 years ...	3.62	82.3	\$24.93	\$6.89
30-49 years	3.96	72.8	29.84	7.54
50-59 years	2.98	21.8	24.92	8.36
60 years and over	2.58	10.2	19.31	7.48

This pattern was quite generally typical of households at each income level. (See charts, p. 2.) A greater proportion of the households in which the homemaker was 60 years and over, however, had incomes of less than \$2,000 than did the other groups--42 percent as compared with from 10 to 20 percent in the others. Hence the average level of food consumption and its value for the 60-and-over group, all incomes combined, reflected the pattern of the households in the lowest income class to a greater extent than was true for the other age groups. On the other hand, it must be remembered that the relatively low family income of the 60-and-over group did not have to meet the needs of as many persons as did the larger incomes of the other groups.

The 30- to 49-year-old group, with an average household size of 3.96, was the most important for its total consumption and the consequent size of its food bill, while the least important was the 60-and-over group, with an average household size of 2.58. It is useful for the food distributor and processor, among others, to know that about three-quarters of the food money is spent by households in which the homemaker is under 50, and only 10 percent by those in which the homemaker is 60 or over.

Age Difference in the Consumption of Specific Foods

Age differences in preferences for specific food items may be more accurately inferred from the comparison of per person rather than per household figures. This is true because household size is important in determining the level of food consumption, and the average household size in the four groups compared differed widely--there was more than a 50-percent difference between the smallest group of 2.58 persons (the

FOOD CONSUMPTION PER HOUSEHOLD

By Age of Homemaker and Income, Spring 1955

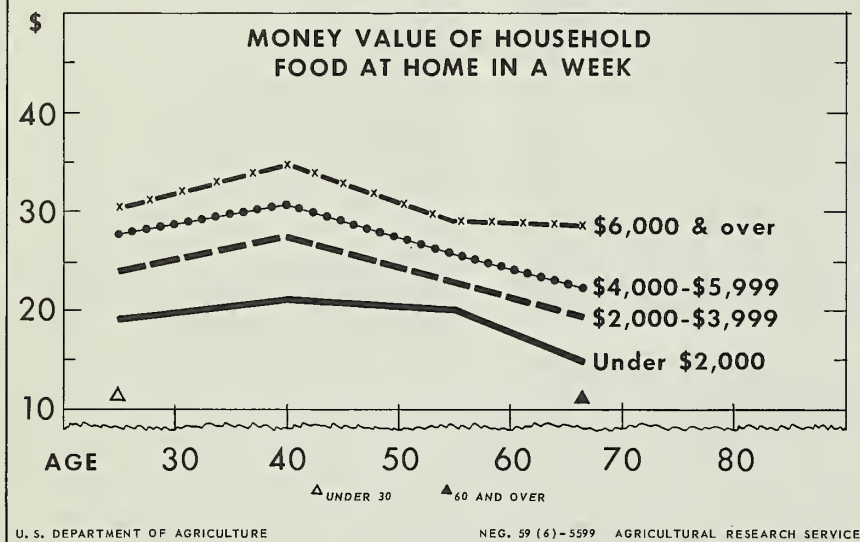

CHART 1

FOOD CONSUMPTION PER PERSON

By Age of Homemaker and Income, Spring 1955*

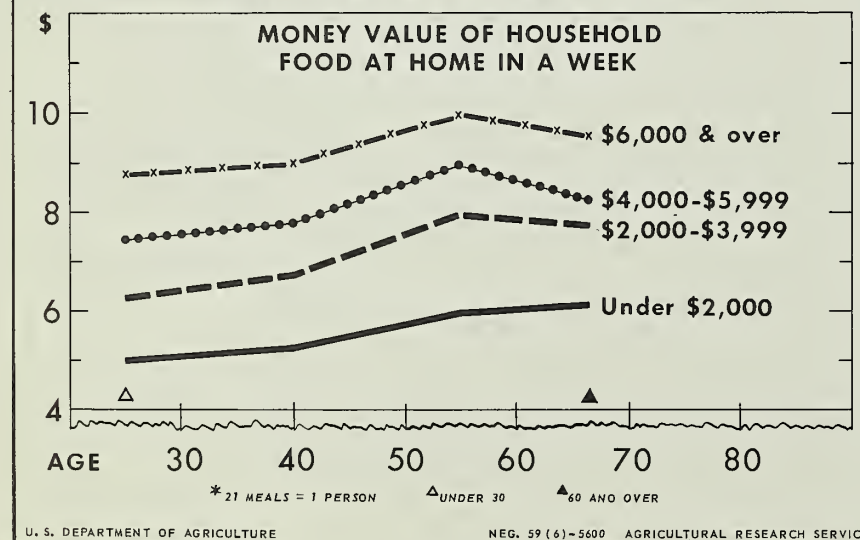

CHART 2

average size of households in which the homemaker was 60 and over) and 3.96 (the average size of households in which the homemaker was 30-49 years). Although the average age of the household members in each of the four groups has not been computed, the age of the homemaker serves as an index of the increasing average age of the members. More than 80 percent of the households in which the homemaker was under 30 had children under 16; only 10 percent of the households in which the homemaker was 60 and over included such children.

Consumption preferences are illustrated by the items in the milk, cream, ice cream, and cheese group. The money value per person of several of the foods in this group, used at home in a week for all U. S. households at two income levels, classified by age of the homemaker, may be compared as follows:

Food item and family income after taxes:	Money value per person, households with homemaker--			
	Under 30 years	30-49 years	50-59 years	60 years and over
Fresh fluid milk:				
\$2,000-\$3,999	\$0.63	\$0.66	\$0.70	\$0.69
\$4,000-\$5,999	.80	.78	.71	.66
Cheese:				
\$2,000-\$3,999	.11	.13	.18	.19
\$4,000-\$5,999	.13	.15	.21	.19
Ice cream:				
\$2,000-\$3,999	.12	.15	.14	.14
\$4,000-\$5,999	.17	.16	.18	.16
Cream:				
\$2,000-\$3,999	.02	.04	.06	.08
\$4,000-\$5,999	.04	.04	.06	.06

Within the lower income ranges--below \$4,000--the per person use of fresh fluid milk was greater rather than less in successively older age groups. At low-income levels the younger homemaker, with a larger family to provide for, had a greater limitation on choice through income restriction than the older homemaker. There was greater use in these younger, low-income households, of processed milk items--condensed, evaporated, or dry milk. At higher income levels young households used considerably more fresh fluid milk than the same age group at lower income levels, but older households used about the same amount of fresh fluid milk at all income levels.

The use of purchased ice cream was consistently greater among all age groups at successively higher income levels, but within a given income range there was no consistent pattern of increase or decrease associated with age. However, between-meal snacks eaten away from home--the ice cream bars or cones purchased by the children, for example--were not included in these figures.

There seems no reason to doubt that there was a greater liking for cheese by those households in which the homemaker was over 50 than by the younger group, and the same holds true, though less strikingly so, for cream.

Meat, poultry, and fish, along with eggs, form the most important main dish component in meals in this country. Relationships among the age groups shown earlier for the total value of food used at home in a week held for both this major group as a whole and most of the individual items within it. Thus the per person use of most meat items, of poultry, of fish, and of eggs tended to be greater at the 30-49 age level than at the under-30 level, to be still greater at the 50-59 level, and then to taper off or decline at the 60-and-over level. There was one rather noticeable exception to this pattern. Luncheon meats, unlike the other items, were used to a greater extent by the two groups with the homemaker under 50 than by the older age groups.

Per person use of all fats and oils followed the same general pattern described above for total value of all food--an increase to a peak in the 50-59 age range and a leveling off or decline thereafter. It was the importance of butter in the total group, however, that set this pattern. The money value of butter used by older groups was greater than the value of that used by the younger groups, but there was no such consistent pattern of age difference for the other items. Margarine, shortening, and salad and cooking oils were used to about the same extent, on a per person basis, by each age group at the same income level. Only salad dressing appeared less popular in households in which the homemaker was 60 and over than in other age groups.

The use of bakery products increased noticeably as income increased but differed relatively little among age groups. Flour other than mixes was more apt to be used by the older than the younger age groups, with the suggestion of a reverse tendency for flour mixes. The use of breakfast cereals followed the pattern described above for fresh fluid milk. At the lower income levels their use increased slightly in successively older age groups, but at income levels above \$4,000 their use was greater in the younger than the older households.

The quantity of sugar used on a per person basis was greater in the older than in the younger households, at least at income levels below \$4,000. Perhaps such use was associated with the greater use of coffee and tea by the older group. It is not surprising to find that the older households drank more tea and coffee--particularly the latter--and consumed less soft drinks, chocolate, and cocoa than younger households.

The money value of all fruits and vegetables, per person, followed the typical pattern--increasing to the peak at the 50-59 age level. The younger households, however, used proportionately more of the processed forms, as is shown by the following figures for the per person money value of all fruits and vegetables (including potatoes, sweetpotatoes) used in a week by all households in the United States with income in the \$4,000-\$5,999 range:

Age of homemaker:	Money value per person	Percentage of total--	
		Fresh*	Commercially processed
Under 30 years ..	\$1.40	58.6	41.4
30-49 years	1.41	64.5	35.5
50-59 years	1.69	66.9	33.1
60 years and over	1.64	68.9	31.1

*Includes fresh produce that was canned or frozen at home.

Some of the processed forms definitely preferred by the younger households were potato chips, commercially canned vegetables (there was little age difference in the use of canned fruits, however), and naturally enough, canned strained and chopped fruits and vegetables. It was only in the 60-and-over group that the use of commercially frozen vegetables and juices appeared to be less well accepted, for the peak use was in the 50-59 group. Dried fruits and vegetables were an exception to the generalization that younger homemakers prefer processed forms--they were used to an increasing extent by successively older age groups.

Consistent with the tendency of the younger groups to use more canned goods and processed foods was their greatest use of most of the items falling within the "miscellaneous" category--soups, mixtures (prepared or partially prepared), nuts, peanut butter. However, the purchase of seasonings followed no age pattern, and the tendency toward decreasing use with age was not very pronounced for such items as pickles, olives, and other relishes, puddings, and leavening agents.

How the Food Dollar was Spent

A convenient way to describe in summary form the patterns of eating of different groups of households is to compare the ways in which they distribute their "food dollars," on the average, to each of the major food categories. For example, each dollar of the value of food consumed in a week was allocated in the following ways by households in the youngest and the oldest groups:

	<u>Homemaker under 30 years</u>	<u>Homemaker 60 years and over</u>
Meat, poultry, fish, eggs	\$0.337	\$0.359
Milk, cream, ice cream, cheese159	.149
Flour, cereals, bakery products106	.098
Fresh fruits and vegetables095	.123
Beverages082	.085
Commercially frozen, canned, and dried fruits and vegetables; juices072	.053
Miscellaneous053	.033
Fats and oils043	.047
Sugars and sweets032	.033
Potatoes, sweetpotatoes023	.020

It may seem strange that the patterns of families differing as much as these do in age composition and size should appear so similar. The average value of the food used at home by the household in a week by these two groups of families, as was shown earlier, did differ considerably, amounting to \$24.93 for the under-30 and \$19.31 for the 60-and-over group. However, the allocation of the average food dollar to any of the major food categories differed at most by only 2 or 3 cents. The relative importance of meat and poultry and of dairy products, as well as of vegetables and fruits in the menu patterns of most households, is reflected in these figures.

Age differences did appear, however, in the selection of individual foods within the broad categories or in the choice among the forms in

which foods are sold, as was shown above. Younger households, as has been pointed out, were more likely to select such items as luncheon meats, canned vegetables, soups, mixtures, fresh fluid and processed milk, soft drinks, chocolate, and cocoa; the older groups were more apt to have more of most types of meat, poultry, fresh fruits and vegetables, cheese, butter, coffee, tea, and sugar. These choices have marketing implications and, when related to the requirements of persons of different ages, nutritional implications as well.

Expenditures for Food Away from Home

The family expense for meals purchased and eaten away from home was on the average less in those households in which the homemaker was 60 years and over than in the other age groups. The lower average resulted from the fewer households having such an expense rather than smaller amounts spent by the families who did buy some of their meals out. In fact, their expenditures, considering the smaller size of these older families, appeared to be quite in line with or even larger than the amounts spent by the other age groups on such meals.

Expense for food and beverages bought to supplement meals carried from home by family members and for between-meal refreshments bought away from home was a more important component of amounts for food away from home in younger than in older households. The proportion of households having expenses for snacks and supplements to meals was greatest in the youngest households and decreased in each succeeding age group. The decline was almost as consistent--though not as steep--as the decline in the proportion of households having children under 16 as is shown in the following figures:

	<u>Percentage of households--</u>		
	<u>Having meals</u>	<u>Having other</u>	<u>With children</u>
	<u>away</u>	<u>food away</u>	<u>under 16</u>
North			
Age of homemaker:			
Under 30 years ..	49	68	81
30-49 years	60	69	75
50-59 years	57	57	18
60 years and over	37	37	9
South			
Age of homemaker:			
Under 30 years ..	45	75	84
30-49 years	56	66	69
50-59 years	41	56	32
60 years and over	24	42	13

Regional and Rural-Urban Comparisons

Other reports on the 1955 Household Food Consumption Survey have highlighted differences in the eating patterns of families living in cities and on farms, and in different sections of the country. In the South, for example, families in general used less milk, meat, and bakery products, but more flour and cereal foods (for their famous hot breads and grits), fats, sugars, and fresh vegetables than in other regions--and more iced tea and cola drinks.

But the division of the population between urban and rural is not the same in all parts of the country, and some of the seemingly regional differences in food consumption are actually differences between urban and rural food habits. The most striking differences between farm and urban families were the relatively greater use of milk, grains, sugars, and fats by farm families and the lesser use of meat. Income, too, is at a higher average level in cities than on farms, and in the North than in the South, both in the urban and in the rural areas, and this affects the average food patterns.

Our concern here, however, is whether the patterns of age differences in food consumption described for all households in the United States were typical for both the North and the South and for farm and urban families. Broadly speaking, most of them were. Such generalizations as the greater use of canned goods and most processed goods by younger households hold for the different population groups.

One type of difference should be pointed out, however. Households were larger on farms and in the rural nonfarm group than in cities; and households in the South, even in the same urbanization classifications, were generally larger than in the North. A larger proportion of rural households had children under 16 years old than was true for urban households, and households in the South in which the homemaker was over 50 were more likely to have such children than comparable families in the North. Associated with these differences in household size and composition, a different pattern of relationship between the money value of food used in a week for the total household and per person, appears in the North and the South as shown by the following figures:

Urbanization and age of homemaker:	<u>Household size (persons)¹</u>	<u>Percentage with children under 16 years</u>	<u>Money value of food</u>	
			<u>Per household</u>	<u>Per person</u>
North				
Urban:				
Under 30 years ...	3.46	80.2	\$26.94	\$7.79
30-49 years	3.82	74.1	32.18	8.42
50-59 years	2.66	16.6	26.25	9.87
60 years and over	2.45	9.4	20.56	8.39
Farm:				
Under 30 years ...	4.17	91.5	29.44	7.06
30-49 years	4.74	79.1	34.42	7.26
50-59 years	3.39	29.7	27.51	8.12
60 years and over	2.66	8.5	21.48	8.08
South				
Urban:				
Under 30 years ...	3.56	80.3	21.08	5.92
30-49 years	3.59	64.3	24.99	6.96
50-59 years	2.84	19.5	19.77	6.96
60 years and over	2.74	10.0	17.71	6.46
Farm:				
Under 30 years ...	4.26	87.1	23.39	5.49
30-49 years	5.00	75.6	26.65	5.33
50-59 years	3.70	35.8	24.50	6.62
60 years and over	3.04	15.3	20.46	6.73

¹21 meals at home = 1 person.

In each of the region-urbanization groups shown, the peak value for household food came when the homemaker was from 30 to 49 years old, but the age group having the peak per person value was different in the North and South. This difference showed up for many of the individual food groups and items.

Some other particular qualifications--which have nutritional implications--may be noted. In the South the group 60 years and over used just as much milk per person as the younger family groups or even more; in the North they used less. In the South the use of eggs increased more steeply as the age of homemaker increased than in the North, and the same was true for butter. On the other hand, the increase in the use of commercial bread and commercially frozen vegetables and juices by the older group was relatively less in the South.

Use of Home-Produced Food by Farm Families

Some of the major differences in farm and nonfarm food patterns in general arise from the use of foods from the farm or home garden. In the 1955 survey it was found that in terms of money value about 40 percent of food used by the farm family was home produced. Home-produced food was relatively more important in the older than in the younger households. It accounted for 44 percent of the total value of food used in a week in those rural farm households in which the homemaker was 50 years or over, but for only 39 percent for the younger group.

The greater relative importance of home-produced food in the older households is somewhat more pronounced in the South than in the North. This is shown by the percentage of total value of all food that was produced at home by the various age groups in rural farm households in the North and South, as follows:

Age of homemaker:	North	South
Under 30 years...	38	38
30-49 years	39	40
50-59 years	41	49
60 years and over	41	44

The home-produced share of most of the major food groups was greater for the older than for the younger households. Exceptions, however, were the meat and milk groups in the North. The percentages of total quantities of important food groups used in a week that were home produced by rural farm households, by age of homemaker, in the North and South are shown as follows:

Percentage of food home produced, households with homemaker--

<u>Under 30</u> <u>years</u>	<u>30-49</u> <u>years</u>	<u>50-59</u> <u>years</u>	<u>60 years</u> <u>and over</u>

¹Includes fresh produce that was canned or frozen at home.

Dietary Adequacy

Earlier reports have indicated that although the average nutritive content of family food supplies was high, there were many families whose food furnished less of several nutrients than the amounts recommended by the National Research Council. (See Glossary, Recommended dietary allowances.) In general, households in the United States with homemakers 60 years of age and over did not fare as well as younger households regardless of income. A somewhat greater proportion of households with homemakers 60 and over than of those in each of the younger groups had diets that failed to meet the recommendations in each of the nutrients calculated. Below are shown the proportions of households using food at home in a week that furnished less than recommended amounts of the nutrients calculated in this survey:

Percentage of households with homemaker--

<u>Under 30</u> <u>years</u>	<u>30-49</u> <u>years</u>	<u>50-59</u> <u>years</u>	<u>60 years</u> <u>and over</u>
---------------------------------	------------------------------	------------------------------	------------------------------------

Thiamine ¹	13	17	19	19
Riboflavin ¹	14	19	20	27
Niacin ¹	5	7	6	10
Ascorbic acid ¹	24	24	24	29

¹Cooking losses deducted.

The relatively poorer nutritional position of the older households can be related to their lower consumption in relation to need for major groups of foods. The meat, poultry, and fish and the grain products groups together are the principal sources of protein, iron, thiamine, and niacin in the diet. As mentioned earlier, meat consumption was higher for each successive age group up to 60, but was less for households with homemakers over 60 than for those in the 50's. The consumption per person of total grain products differed very little among the age groups. Most of the younger households included children who have lower requirements for most nutrients than adults, as contrasted with

the relatively few homemakers over 50 who had children in their households. Therefore, the younger groups could meet their protein, iron, and B-vitamin needs with less meat and grain than the older households. The two oldest groups, on the other hand, had about the same need for these foods per person, but the oldest group did not use as much meat, poultry, and fish as the 50-year olds and used no more grain products. Consequently more of their diets failed to reach recommended levels in the nutrients supplied by these foods.

Nearly all of the ascorbic acid and about half of the vitamin A in diets in the United States come from fruits and vegetables. More older than younger households had diets below recommended allowances in both of these vitamins. Consumption of all fruits and vegetables, whether fresh or processed, was greater for households in each successive age group up to those with homemakers in the 50's, but less for the oldest group.

Thus, as with the foods and nutrients discussed earlier, more of the younger households used enough fruits and vegetables to meet the needs of their households with children, whereas the oldest all-adult households did not use enough.

Use of the ascorbic acid-rich citrus fruits and tomatoes and of the vitamin A-rich dark-green and deep-yellow vegetables followed the same pattern as total fruits and vegetables. Quantities of fruits and vegetables used at home follow:

	<u>Pounds per person in a week,</u> <u>households with homemaker--</u>			
	<u>Under 30</u> <u>years</u>	<u>30-49</u> <u>years</u>	<u>40-59</u> <u>years</u>	<u>60 years</u> <u>and over</u>
Potatoes	1.80	1.80	1.88	1.79
Dark-green and deep-yellow vegetables (including sweetpotatoes)49	.57	.70	.62
Tomatoes and citrus fruit	1.88	2.05	2.12	1.95
Other vegetables and fruit	4.56	4.96	5.50	5.19
Total	8.73	9.38	10.20	9.55

Not all of the relationships between age and dietary adequacy that were found in the country as a whole were to be found in all parts of

the nation. For example, calcium shortages were more likely to be found in households with homemakers over 60 than in younger households when the country as a whole was considered. However, among southern families homemakers over 50 were least likely to provide diets failing in calcium, as shown by the following percentages of households using food at home in a week that furnished less than NRC recommended amounts of calcium:

Age of homemaker:	<u>United States</u>	<u>North</u>	<u>South</u>
Under 30 years	28	23	37
30-49 years	30	27	34
50-59 years	25	22	31
60 years and over ..	31	32	32

Regional differences in calcium adequacy were related to differences in milk consumption. In the North use of milk, ice cream, and cheese was progressively less for each successive age group. In the South quantities of the milk group used were somewhat less for households with homemakers over 50 than for those younger. However, since adults need less calcium than children the older, preponderantly childless families needed less milk to meet their calcium needs.

Food supplies of older households in both regions were poorer in riboflavin. Riboflavin as well as calcium comes principally from milk. Adults need less calcium but more riboflavin than most children. Hence, the older households were relatively worse off in relation to riboflavin than to calcium because of their lower consumption of milk and milk products.

In summary, it should be noted that while age differences have appropriately been stressed in this abstract, the differences were not so great as the similarities. The dietary in the United States does not have clearly defined age subcultures. Further, the acceptance by the older homemakers of relatively new foods such as frozen vegetables and fruits is suggested. Traditional consumption patterns may be more accessible to change than some had supposed. Scientifically sanctioned food innovations seem to find a place in the households of older homemakers as well as of the younger ones.

DESCRIPTION OF SURVEY

This report contains a portion of the data from the U. S. Department of Agriculture's nationwide Survey of Household Food Consumption made in the spring of 1955. The survey was part of the Department's broad program of research on family dietary levels and the marketing and utilization of farm products.

Periodic examinations of food consumption of population groups are needed for many purposes--for administration of public programs affecting food supply, distribution, and consumption; for educational programs to improve food habits; and for private efforts to broaden and improve the marketing of foods. Nationwide surveys of food consumption were made in 1936 and 1942, and a survey of food consumption of urban families in 1948. No surveys of rural families have been made since 1942 except on a regional basis.¹

The 1955 survey is the most comprehensive yet undertaken. Its objectives, like those of the earlier surveys, were to obtain information on patterns of household food consumption and expenditures, dietary levels, and food practices. In this report the households are grouped (1) by regions--North (Census of Population regions Northeast, North Central, and West combined) and South; (2) by urbanization--rural farm, rural nonfarm, and urban--within regions; (3) by several family income classes within region-urbanization categories; and (4) by several age-of-homemaker classes within region-urbanization-income categories.

The survey was based on a national probability sample of approximately 6,000 housekeeping households of one or more persons. Housekeeping households were defined as those in which at least one member had 10 or more meals from home food supplies during the week preceding the interview.² Institutions and persons living on military reservations were not represented. To assure adequate farm coverage, the sample included in addition to a basic cross section of about 4,500

urban, rural nonfarm, and rural farm households, a supplemental sample of about 1,500 farm-operator households. Hence it was necessary in combining the data for rural farm and the other urbanizations, to use appropriate weights in order to obtain the "all-urbanizations" averages. A more detailed description of the sample design and its appraisal is given in Reports 1 to 5 of this series.

Collection of the data, made during April, May, and June of 1955, was by personal interview with a household member, usually the homemaker. Information was obtained on quantities of food consumed or used up in the household during the 7 days preceding the interview and expenditures for the purchased items, on the number of meals eaten at home by each household member, expenditures for food eaten away from home, and the number of meals purchased away from home or received as gift or pay, and on selected family characteristics, including income, age, employment, and education of the homemaker, and household food practices, such as home baking, canning and freezing, and production of food.

In requesting the information from households, trained interviewers used a schedule including a detailed food list to help respondents recall the quantities of foods used during the week and the amounts paid for purchased items. (This method is sometimes referred to as the "recall-list method.") Since the success of surveys of this type depends in large part on the interviewer's skill in drawing out the necessary information from the person interviewed, considerable care was taken in the selection and training of the interviewers. At training schools lasting from 3 to 5 days, instructions and practice in the sampling phase of the survey, in interviewing, and in recording in correct form on the schedule were given to each interviewer. In addition, to insure that all interviews would be conducted in an identical and systematic fashion, each interviewer was furnished a manual of instructions covering each phase of the survey for use during training school and for reference during the collection period.

A glossary beginning on page 131 explains the major terms used in this study.

NOTES ON USE OF TABLES

The tables that follow give data only for households. For analyses on a per person basis, averages per household may be divided by the number of persons per household shown in table 2.

Each table includes data for each region, each urbanization (except tables 19 and 20), each income class, and each age group.

Where combinations for groups of households are needed, they may be computed by using the counts shown in table 1. In making combinations, the appropriate adjustments for the oversampling of the rural farm households must be made. For example, in combining income classes for "all urbanizations," the columns showing the weighted counts, where this adjustment has already been made, should be used.

In combining rural farm and rural nonfarm into a single rural group, the full count of rural nonfarm, but only one-fourth of the rural farm households shown in table 1, should be used.

Table 1 presents the counts of survey households in each of the region, urbanization, income, age of homemaker classification groups for which percentages or averages are shown in this report. Households covered are those of 2 or more persons that included a homemaker whose age was reported (see Glossary, Age of homemaker). Although this report does not show separate data for households not classified by income, counts of these households are presented in table 1 to show what is included in "All incomes" classes.

¹See p. 134 for list of earlier surveys.

²Data included in this report are for households of 2 or more persons with a wife or female head reporting age.

The number of households in some of the cells is small but data are shown for each to permit maximum flexibility in analyses.

Table 2 shows the average household size in equivalent persons (21 meals at home equal 1 person), the percentage of households that included children under 16 years of age, and the money value of and expenditures for foods and beverages used at home in a week. For rural farm households the money value of home-produced foods used at home in a week is also shown.

Household averages have been divided by average household size to get averages per person in this table (and in the analyses presented in the Highlights). The use of the number of 21-meal-at-home equivalent persons for computing averages per person is an attempt to adjust for the fact that the number of persons in the family is not always identical with the number of persons eating from household (home) food supplies. Some members may have eaten meals away from home and nonfamily members (guests, hired help, boarders) may have eaten from the respondent's household food supplies. This method has the limitation of assigning equal weight in quantity and cost of all meals (morning, noon, and evening) and makes no allowance for any difference between amounts or kinds of food at meals eaten away and those served at home.

Because of rounding, the total money value of all food used in a week, shown in table 2, may not equal the sum of averages for food groups shown in tables that follow, nor in turn will the sum of averages of food items comprising a food group always equal the group average. Similarly, average quantities for food groups and subgroups may not equal the sum of averages for corresponding items, partly because of rounding and also because some quantities have been converted to equivalent. Also a few inconsistencies, affecting both quantities and money value, occurred in tabulating, but differences resulting therefrom are usually small, rarely more than 1 or 2 percent.

Table 3 presents family expenditures for purchased meals, supplements to meals, snacks, and beverages consumed away from home by family members, guests, and household help, and the percentage of families having such expenditures in a week. Tips and sales taxes are included. Similar information was not obtained for household members that did not pool income with the primary economic family, such as boarders, farm help, and members of secondary economic families. The average household size in 21-meal equivalent persons is not, strictly speaking, applicable as a divisor for computing averages per person.

Tables 4, 5, and 6 present, respectively, the percentage of households using, the quantity, and the money value of major groups of foods

used at home in a week per household. Foods are grouped according to the form in which they appear in the retail market (see Glossary, Food used at home). Data in these tables pertain to foods from all sources combined, that is, purchased, home-produced, or received as gift or pay. For the most part food was reported in the form in which it was brought into the household, whether purchased, produced at home, or received free; foods included in homemade mixtures used during the week were usually reported as the respective ingredients, with the source of each specified. In these tables all bakery products and frozen and canned vegetables and fruits are commercial products.

Tables 7 through 18 include percentages and averages for subgroups of foods included in the major food groups shown in tables 4 through 6, and pertain to food from all sources, usually as brought into the home. However, some homemade foods were reported in the form used rather than as brought into the kitchen. Among these exceptions are home-made butter, cream, and cottage cheese, reported as such rather than as milk, because of the difficulty of correcting quantities for unused byproducts. Homemade jellies, jams, and preserves, home-dried vegetables and fruits, home-canned soups, and homemade pickles and relish-type foods were also reported and tabulated in their processed state (see Glossary, Food used at home).

Tables 19 and 20 are limited to selected foods produced at home by rural farm households (see Glossary, Food home-produced). Percentages of households using and quantities per household are shown.

Tables 21, 22, and 23 present some of the same basic data as tables 4 through 18, but here the foods are grouped to take account of their nutritional rather than their marketing characteristics (see Glossary, Nutrition groupings of food). Only selected nutrition groupings of food are included. For data on foods omitted here, the reader is directed to earlier tables.

Averages in tables 4 to 23 are based on all households in the cell (table 1) whether or not they used the specified food. Since the percentage of households using the food is shown, averages for these households only can be obtained by dividing the average for all households in the cell by the percentage using.

Table 24 shows the percentage of households using food at home that did not furnish specified amounts of 8 nutrients. Two levels are shown, the higher representing recommended amounts, based on the recommended dietary allowances of the National Research Council (see Glossary, Recommended dietary allowances). For this table the nutrient content of food used in each household was calculated separately (see Glossary, Nutritive value of diets).

1/ The sample contains 4 times as many rural farm schedules as are required to provide proportionate representation of all groups. "All urbanizations" is shown both with and without the extra schedules. The effective sample size (i.e., the size a self-weighting sample would have to be to yield the same standard error as the existing sample), which would be used for judging reliability of the tabulated data, is somewhere between the two. The total including all farm schedules is the correct estimate of the effective sample when the standard deviation of the nonfarm data is 1/2 that of the farm. The total including 1/4 of the farm schedules collected is more nearly correct when the standard deviation of the nonfarm data is 1-1/2 that of the farm. Limited evidence from previous studies suggests that this ratio is less than 1 for most items. 2/ Includes a few urban farm households. 3/ Includes families unwilling or unable to report their income; includes also a few households with no economic family during the week preceding the interview and/or in 1954.

NOTE: Component items may not add to totals because of rounding.

GLOSSARY

AGE OF HOMEMAKER (WIFE OR FEMALE HEAD)

Age at last birthday. Households in which the homemaker's age was not reported and those in which there was no wife or female head are not included in this report.

COOKING LOSSES

See "Nutritive value of diets."

DIETARY ADEQUACY

Refers to nutritive value of foods used at home per equivalent nutrition unit in relation to recommended dietary allowances. (See "Nutritive value of diets," "Recommended dietary allowances," and "Notes" on use of table 24.)

EQUIVALENT NUTRITION UNIT

The equivalent of an adult male in terms of allowances for a specified nutrient. The number of nutrition units in a household for a given nutrient tells how many times the amount recommended for an adult male 25 years of age is needed by that household to meet recommended allowances for the nutrient. (See "Recommended dietary allowances.")

FAMILY, ECONOMIC

Defined for purposes of this study as a person living alone or a group of persons who lived together and drew from a common fund for their major items of expense. All unmarried sons and daughters who lived at home were considered part of the economic family. Other persons, related or unrelated, who lived with the family were considered members of the economic family if they drew from the common family fund for food, housing, and automobile expenses and, in addition, for at least one other category of major expense such as clothing or medical care, or if they pooled their savings with those of the family. Family members temporarily away from home--at school, at work, or on vacation--were considered members of the economic family, although not residing in the dwelling unit at the time of the interview.

FAMILY, ECONOMIC, PRIMARY

There may have been more than one economic family in a household unit. If so, the one that was more closely connected with maintaining the dwelling unit was the "primary" one.

FAMILY, ECONOMIC, SECONDARY

If two or more economic families were present in a household, members of the one not considered primary (see above) were considered in the same way as boarders and hired help, i.e., they were counted in terms of 21-meal equivalents in computing household size, but information on their expenses for food away from home and their income was not requested.

FARM

Defined as in the United States Census of Agriculture, 1950: Places of 3 or more acres were counted as farms if the value of agricultural products raised on them in 1954, exclusive of home gardens, amounted to \$150 or more. The agricultural products could have been either for home use or for sale. Places of less than 3 acres were counted as farms only if the value of sales of agricultural products in 1954 amounted to \$150 or more.

FARM HOUSEHOLDS

A household that included a farm operator. (See "Farm" and "Farm operator.") Those few farm households that lived in urban places were tabulated as urban schedules.

FARM OPERATOR

As defined in the United States Census of Agriculture, 1950, i.e., a person who was responsible for the operation of farmland. He may have performed the labor himself or directly supervised it; he may have been either an individual operator or one of a group of individuals acting as partners. Control may have been through ownership or through lease, rental, or cropping arrangement. An operator was distinguished by the decision-making function. A hired manager was considered an operator inasmuch as he was hired to make decisions and normally to do farm-work. A farm laborer who worked for wages and did not make decisions was not considered a farm operator. A person who rented land to others, receiving a share of the product or cash for use of the land, was considered a landlord and not a farm operator.

FOOD FROM ALL SOURCES

Foods purchased, home-produced, and received as gift or pay.

FOOD HOME-PRODUCED

Includes foods raised for home use and those obtained by hunting, fishing, and collecting wild fruit and nuts. Excludes home-canned, home-frozen, and home-baked foods that were prepared from purchased ingredients.

FOOD USED AT HOME

Food "used" means food used in an economic sense, rather than ingested, and includes food eaten, thrown away as waste, or fed to pets, but excludes food given away. (Special pet foods, not commonly eaten by people, are not included, but edible food bought for animals is included.) Food carried from home in packed meals as well as food served at home is included.

If food was prepared but not used during the survey week (7 days preceding the interview), it was not recorded. If, however, a portion of a

home-prepared dish, such as a cake, was used during the period, an estimate of the amount used of each of its ingredients was reported. In the same way, food prepared before the survey week that was used during the week was included. Foods that were canned or frozen during the survey week were not included, except for that quantity eaten during the week.

Foods were generally tabulated according to the form in which they were brought into the kitchen. Thus, homemade cake and bread were recorded as flour and other ingredients, but purchased cake and bread were entered as cake or bread. In this way, some eggs, fat, sugar, milk, and other foods consumed by households are reported under baked goods, ice cream, canned fruits, soft drinks, and the like, because that is the way they entered the kitchen. Home-canned and home-frozen fruits and vegetables that were consumed during the week were tabulated as fresh products, with sugar disregarded. Tabulations of canned and frozen fruits and vegetables in this report include only commercial products, but homemade jams, jellies, and preserves, home-canned or frozen soups, juices, pickles, and relishes are included with commercially packed items because of the lack of standardized recipes for breaking these homemade items into ingredients. These homemade mixtures were considered to be home-produced if household members had produced the chief ingredients, i.e., the fruit used for jellies, the cucumbers used in pickles.

HOMEMAKER

Wife of the head of the family or herself the head. Data for households which did not include a homemaker as here defined are not included in this report.

HOUSEHOLD

Group of persons who shared a common food supply during the week of the survey. Includes family members, housekeeping groups of unrelated persons, and guests, boarders (if fewer than five), and hired help.

HOUSEHOLD ELIGIBLE FOR SURVEY

One in which at least 1 person had 10 or more meals from household food supplies during the preceding 7 days.

HOUSEHOLD SIZE IN WEEK

The total number of meals served to all persons in the household was divided by 21 to obtain the household size in equivalent persons. The count of equivalent persons was not reduced in those households where persons omitted meals nor was it increased for between-meal snacks or additional meals, such as those served to invalids or young children.

Lunches carried from home and supplemented by purchased food were considered one-half meals; those supplemented by beverages only were counted as full meals. Refreshments served to members of the household were not counted as meals unless they served as substitutes for regular meals. Refreshments served to guests were counted according to the number of meals which they approximated.

HOUSEKEEPING HOUSEHOLD

One in which at least 1 person had 10 or more meals from household food supplies during the preceding 7 days.

Only housekeeping households of two or more persons are included in this report.

MILK TOTAL--CALCIUM EQUIVALENT

Approximately the quantity of fluid milk to which various dairy products (except butter) are equivalent in calcium. The chief source of data on the calcium content of the various dairy products was "Composition of Foods--Raw, Processed, Prepared," U. S. Department of Agriculture, Agriculture Handbook No. 8, June 1950.

MONEY INCOME, AFTER INCOME TAXES

Money income, after deduction of Federal and State income tax payments, of all persons who were members of the family during all or any part of 1954. Income included wages and salaries, net income from self-employment including farming, from real estate, and from boarders; interest, dividends, and mineral rights; pensions, annuities, allotments, contributions, relief payments, social security; unemployment insurance payments; and gross receipts from roomers. Excluded were lump-sum payments of inheritances and insurance policies. Farm income was the total of all farm receipts during the year (after payment of share rent to others) minus farm operating expenses. Farm operating expenses did not include purchases of land, depreciation or purchase of machinery, or building improvements. Net change in inventories of livestock or crops was not counted as income. Income taxes paid in 1954 were deducted from net receipts during the year.

Some households were not classified by income, either because the family was unable or unwilling to give the information regarding income or because the 1954 income was not pooled and shared by the housekeeping group.

MONEY VALUE OF FOOD USED AT HOME IN A WEEK

Includes cost of purchased food and alcoholic beverages (at price paid for the item at time of purchase as reported by the respondent), and money value of food produced at home or received as gift or as pay (valued at prices reported by families in the same region and urbanization group purchasing a similar item).

NOT CLASSIFIED BY INCOME

Housekeeping households in which the income was not pooled and shared, and those that were unable or unwilling to give information about income.

NUTRITION GROUPINGS OF FOOD

Food classified into groups having similar nutritive values. These groupings, used in tables 21, 22, and 23, take account of the nutritional characteristics of foods rather than the form in which they appear in the retail market.

NUTRITION UNIT

See "Equivalent nutrition unit."

NUTRITIVE VALUE OF DIETS

Nutrients in the food reported used were calculated chiefly from table 2 of U. S. Department of Agriculture Handbook No. 8, "Composition of Foods--Raw, Processed, Prepared." This table shows quantities of nutrients obtained in the edible portions of foods purchased in generally good condition and makes allowances for inedible portions such as bone, pits, shells. For a large number of items the values in this table were revised in accordance with newer data on yields from U. S. Department of Agriculture Handbook No. 102, "Food Yields--Summarized by Different Stages of Preparation." For retail food supplies in the forms currently marketed, with a normal amount of wilt, spoilage, and other types of loss, these newer data were considered more suitable than the yield figures based on the earlier publication. Values for foods not included in Handbook No. 8 were unpublished data from the files of the Department's Food Composition Unit, Household Economics Research Division.

For this survey, estimated average losses in cooking for thiamine, riboflavin, niacin, and ascorbic acid were deducted from the composition values before these were applied to the food quantities. Loss factors used were developed for groups of foods and were based on experimental data with consideration given to usual cooking practices in the United States.

How much food was discarded either as plate waste or during or after preparation was not reported. Hence amounts in the food actually eaten may be smaller than the amounts on which table 24 of this publication is based and this table may understate the number of households with food not furnishing specified amounts of nutrients.

The nutritive content was calculated only for foods. No estimate was made of the minerals in the local water or in baking powder, of calories in alcoholic beverages, or of any vitamin or mineral supplements.

RECOMMENDED DIETARY ALLOWANCES

Levels of nutrient intake that the Food and Nutrition Board of the National Research Council recommends as normally desirable goals or objectives toward which to aim in planning practical dietaries. (Food and Nutrition Board, National Research Council Publication 302, Rev. 1953.) For this report the 1953 allowances were used as modified for application to dietary surveys by C. LeBovit and H. K. Stiebeling in

"Applying 1953 Dietary Allowances to U. S. Population Groups" (Amer. Diet. Assoc. Jour. 33:219-224, 1957).

REGIONS

The classification of States used by the 1950 Census of Population was followed. The South includes the following States: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, West Virginia. The North (North-east, North Central, and West combined) includes all States outside the South.

RURAL FARM

See "Urbanization."

RURAL NONFARM

See "Urbanization."

URBAN

See "Urbanization."

URBANIZATION

Census of Agriculture definitions of urban, rural nonfarm, and rural farm were used. Urban households lived in communities of 2,500 or more persons or in the fringe areas around cities of 50,000 or more. Farm households were those that included a farm operator, a person responsible for the operation of a farm, either performing the labor himself or directly supervising it. (See "Farm" and "Farm operator.") Those few farm households that lived in urban places were tabulated as urban schedules. Rural households, those living outside urban places, were classified as rural nonfarm or rural farm, depending on whether a farm operator lived in the household.

All urbanizations includes urban, rural nonfarm, and rural farm households. Because the sample contains 4 times as many rural farm schedules as were required to provide proportionate representation of all groupings, the total all urbanizations is a weighted total. The appropriate weights are 1, 1, and 1/4 for urban, rural nonfarm, and rural farm households, respectively. The number of households in each urbanization and region is given in table 1. When combining rural farm data with urban or rural nonfarm data it is necessary to divide by 4 the number of rural farm households shown in table 1.
